

STUDY SUMMARY

**Tempur-Med® Assists Patients with Dementia and
Alzheimer's Disease**

Patients suffering from Alzheimer's disease and other forms of dementia are less agitated when sleeping on TEMPUR® mattresses.

Significant Findings

A pilot study¹ at a major U.S. research university found significant correlations between TEMPUR mattresses and reduced levels of agitation in Alzheimer's patients. The correlation was significant enough to lead investigators to suggest that use of the bed may serve as adjunctive therapy to pharmacotherapy for agitated dementia patients.
